

The speed that any NH_3 is removed by your system will be a good indicator of aquarium filter and bacteria health.

NH_3 is the most toxic thing in your aquarium and much more dangerous than nitrite which is second stage in the [maturation cycle](#).

If you have been [fishless cycling](#), we would really recommend using a new seneye slide when you add fish after your final water change.

Commercial Ammonia is a very powerful oxidiser and can do strange things!
